What was completed in this sprint?

- Completed the refactoring period for the implemented features in previous sprints, including:
  - Removing functions that were no longer required due to a slight alteration in the model or as an effect of fixing a bug.
  - Ensured that all files have appropriate code comments to aid in the readability of the code written.
  - Added additional tests to ensure that all implemented features for sprint 4 as working correctly and as expected.
- Continuous Deployment files were cleaned up and made easier to read
- Collation of CSS styling
- Creating new employees and Editing employee information if the logged in user is an admin
- Worker being able to see their assigned working days
- Employee setting availability for each day
- Cancelling a booking no less than 48 hours prior to set time
- Providing business trading hours
- Improved analytical data

What has not been done?

- *All tasks that were assigned for this sprint were completed*

The features that were implemented in sprint 4 were the main focus for this refactoring period, including roster functionality, employee registry and analytical data. The goal was to increase readability of the code as well as remove any that was no longer required by the functionality that was implemented. This was done by adding extensive commenting, particularly for react code that handles webpage functionality as well as the back-end components.

There was a few features that were rolled over to this sprint that were already in progress, however we ensured they were completed prior to commencing the refactoring. These included the alterations in the analytics page as well as a few roster functionality components.

This was all collated into the developer branch ready to be pushed to deployment.
